DIMMER SWITCH USE INSTRUCTION:

ON and OFF: quick pressure (less than 1 sec).

At ON, in order to help ignition of the lamp, it goes to the max dimming value, after that it reaches latest memorized value.

MIN. and MAX: Continuous pressure (at every release of the button pressure the direction of the dimming is inverted).

Memorization of the latest setting made. It keeps the memory of last dimming, even in case of switching-off from a controlled electrical socket.

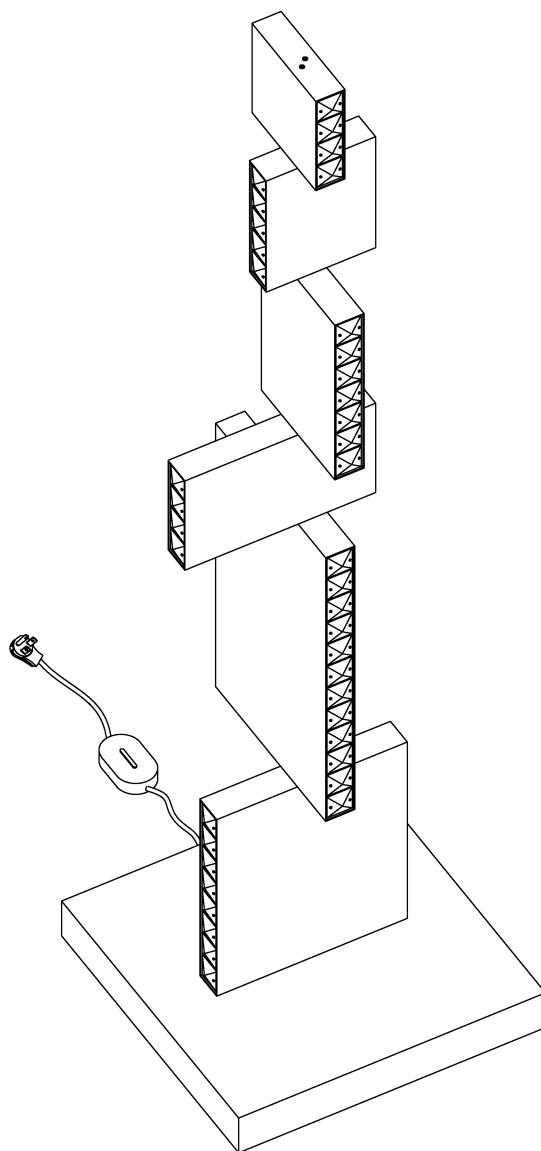

How to set the minimum adjustment modality: keep the button pressed for about 30 seconds to enter the minimum adjustment modality.

Once you have entered this function:

- the lamp switches on at the maximum brightness for about 2 seconds.

- Every 2 seconds the minimum brightness changes sequentially on 6 default values

- to confirm the choice, release the button in correspondence of the wished brightness.
