

## **STERIGENICS ANNOUNCES UPDATES TO ATLANTA FACILITY CONSTRUCTION TIMING**

*Expedited schedule will enable complete installation of enhancements by the first week in October*

*Sterilization operations will be suspended until construction is complete*

September 6, 2019 – Atlanta, GA – Sterigenics, a leading provider of mission-critical sterilization services, today announced that it now expects to complete the installation of enhancements to further reduce ethylene oxide (EO) emissions at its Atlanta facility by the first week in October, well ahead of its initial estimates, and released the following statement:

“At the request of Governor Kemp and the EPD, Sterigenics has been working to expedite the installation of technology enhancements to our Atlanta facility and, as previously announced, has been operating under a reduced production schedule. The construction is proceeding ahead of schedule. We have determined that suspending sterilization operations, and the use of EO in those operations, throughout the duration of the work will enable us to further accelerate the installation of these enhancements and that doing so is the most efficient path to meeting the requests of all stakeholders.

“As we implement these enhancements to ensure that our facility operates in line with the highest control standards in the country, our team is also working with customers to minimize the impact on the supply of vital sterile medical products to hospitals and the patients who depend on them every day.”
