### Clean Water Is Crucial Especially During A Pandemic

It is true that water is an essential part of life for all of us. It is a basic human need. We need up to 50 liters of water daily in order to keep clean and nourish our bodies. Water is also something that, we as Americans, take for granted. It is easily accessible for us, though that is not the case around the world. Our water is not only accessible, it is clean. We rely on many different workers and many different sources to ensure that this happens. From lakes and rivers to treatment plants and systems that bring our water to where we are, we are given clean water to use in cooking, cleaning, bathing, and drinking. Our world has been turned upside down with COVID-19. Even during this pandemic, we are still able to have clean water. This is more important than ever, as we have to be cautious and careful to treat our bodies well and take care of each other.

People who work to make our water clean and safe are essential. We have access to clean water day and night while others outside of America may not have that privilege. One of the best ways to slow the spread of COVID-19 is to wash our hands. Because we have clean tap water that is always running, we are able to stay healthy with clean hands. This water runs thanks to water professionals. These workers provide safe and clean water that we use throughout our day.

During this time, it is more important than ever to have clean drinking water. We must do all that we can to keep our immune systems strong and healthy. Drinking water can come from public water systems. The workers there regulate and filter the water to make sure it is safe for

drinking. Water must be treated so that it will be safe to drink. Clean drinking water has to be inspected and tested.

To sum it up, we use water throughout our daily lives through all that we do. We seem to take this important resource for granted. But, when we learn about how much we need water, we then see that water is an essential part of life. We cannot go without water. Water is crucial to keeping us healthy on the inside of our bodies like our immune systems and hydrating our skin on the outside and washing our hands to prevent sickness. This pandemic has been a struggle for millions of people. We owe many thanks to all of the water workers who help to keep our water clean.
