SFP+ Timing Requirements

Parameter	Symbol	Min.	Max.	Unit	Notes/Conditions
Tx_Disable Assert Time	t_off		100	µs	Rising edge of Tx_Disable to fall off output signal below 10% of nominal.
Tx_Disable Negate Time	t_on		2	ms	Falling edge of Tx_Disable to rise output signal above 90% of nominal. This only applies in normal operation, not during start-up or fault recovery.
Time to Initialize 2-Wire Interface	t_2w_start_up		300	ms	From power on or hot plug after the supply meeting.
Time to Initialize Cooled Module and Time to Power Up a Cooled Module to Power Level II	t_start_up_ cooled		90	sec	From power supplies meeting or hot plug, or Tx_Disable negated during power up or Tx_Fault recovery, until cooled Power Level II part during fault recovery is fully operational. Also, from stop bit-low-to-high SDA transition enabling Power Level II until the cooled module is fully operational.
Tx_Fault Assert for Cooled Module	Tx_fault_on_ cooled		1	ms	From occurrence of fault to assertion of Tx_Fault.
Tx_Fault Reset	t_reset	10		µs	Time Tx_Disable must be held “high” to reset Tx_Fault.
Rx_LOS Assert Delay	t_los_on		100	µs	From occurrence of loss of signal to assertion of Rx_LOS.
Rx_LOS Negate Delay	t_los_off		100	µs	From occurrence of presence of signal to negation of Rx_LOS.
Maximum Current Ramp on Power Supply					
Icc Instantaneous Peak Current			800	mA	Notes 1, 2
Icc Sustained Peak Current			660	mA	Notes 1, 2

Notes:

1. The maximum currents are the allowed currents for each power supply (VccT or VccR); therefore, the total module peak currents can be twice this value. The instantaneous peak current is allowed to exceed to specified maximum current capacity of the connector contact for a short period.
2. Not to exceed the sustained peak limit for the more than 50µs. May exceed this limit for shorter durations.
