Low Speed Control Pin Logic Levels

Parameter	Symbol	Min.	Max.	Unit	Conditions/Notes
Host VCC Range	Host_VCC	3.14	3.47	V	with $\pm 5\%$ variation
TX_Fault, RX_LOS	VOL	0.0	0.40	V	Note 1

TX_Disable	VIL	-0.3	0.8	V	Pulled up with 10k ohms to VccT in the module.
	VIH	2.0	VCC + 0.3	V	

Notes:

1. Rpullup (Rp) is the pull up resistor. Active bus termination may be used by the host in place of a pullup resistor. Pull ups can be connected to multiple power supplies, however the host board design shall ensure that no module pin has voltage exceeding module. Measured at the Host side of the connector.

TX_Fault is a module output pin that when High, indicates that the module transmitter has detected a fault condition related to laser operation or safety. The TX_Fault output pin is an open drain/collector and must be pulled up to the Host_Vcc with 4.7k-10k Ω on the host board

TX_Disable is a module input pin. When TX_Disable is asserted High or left open, the SFP+ module transmitter output must be turned off. The TX_Disable pin is pulled up to VccT with 10k Ω in the SFP+ module. The TX_Disable pin works for TX_fault_Reset as well.

Mod_ABS is pulled up to Host_Vcc with 4.7k-10k Ω on the host board and connected to VeeT or VeeR in the SFP+ module. Mod_ABS is then asserted “High” when the SFP+ module is physically absent from a host slot. In the SFP MSA (INF8074i) this pin had the same function but is called MOD_DEF0.

RX_LOS when high indicates an optical signal level below that specified in the relevant standard. The RX_LOS pin is an open drain/collector output and must be pulled up to host Vcc with a 4.7k-10k Ω on the host board. RX_LOS assert min and de-assert max are defined in the relevant standard.

CDR Control for Bypass Mode

- Default value for “Soft RS0” and “Soft RS1” is ‘0’
- Hard pin#7 for RS0 and hard pin#9 for RS1 are terminated to Ground through 30kohm.

	Hard: Pin #7	Soft: A2h, Byte 110 bit 3	Mode of Operation
RS0	0	0	CDRR bypass mode
	0	1	CDRR engaged mode
	1	0	CDRR engaged mode
	1	1	CDRR engaged mode

	Hard: Pin #9	Soft: A2h, Byte 118 bit 3	Mode of Operation
RS1	0	0	CDRT bypass mode
	0	1	CDRT engaged mode
	1	0	CDRT engaged mode
	1	1	CDRT engaged mode

18	TD+	Transmitter Data In (CML-I)	
19	TD-	Inverse Transmitter Data In (CML-I)	
20	VeeT	Transmitter Ground	1

Notes:

1. The module signal grounds are isolated from the module case.
2. This is an open collector/drain output that on the host board requires a 4.7KΩ to 10KΩ pull-up resistor to VccHost.
3. This input is internally biased high with a 4.7KΩ to 10KΩ pull-up resistor to VccT.
4. Two-Wire Serial interface clock and data lines require an external pull-up resistor dependent on the capacitance load.
5. This is a ground return that on the host board requires a 4.7KΩ to 10KΩ pull-up resistor to VccHost.
6. Rate select can also be set through the 2-wire bus in accordance with SFF-8472 v. 12.1, Rx Rate Select is set at Bit 3, Byte 110, Address A2h. Tx Rate Select is set at Bit 3, Byte 118, Address A2h.

Note: writing a “1” selects maximum bandwidth operation. Rate select is the logic OR of the input state of Rate Select Pin and 2-wire bus.
