OC-4600
Compact Size, Powerful Connectivity

The OC-4600 is a dual-ethernet port wireless 4G LTE Category 4 router that was designed for applications that require higher download speeds like micro markets, kiosks, gaming terminals, digital signage, and many others. While it works great in those demanding environments, it also works perfectly in lower bandwidth applications like ATMs, smart safes, point of sale, and monitoring systems.

Faster Speed

This new router will replace the OC-4100 and OC-4500 routers and will provide enhanced speed and functionality in a much smaller form factor. Along with these major improvements, customers will also still get the same great managed services including 24/7 customer support, real-time monitoring and management, lifetime access to our cloud-based device management platform, Summit, and so much more.

Fully Managed

Rather than simply providing the connection to the internet, we bundle that with an entire suite of managed services that provide less stress and worry for operators since every necessary component is taken care of. All the operator needs to do is connect their device to power and we help take care of the rest so that they can focus on their core business instead of connectivity challenges.

Greater Uptime

With our dedicated team of connectivity experts, paired with our industry-leading hardware and software, our customers enjoy greater uptime and peace of mind. The OC-4600 is the latest evolution in our commitment to provide the best hardware so that our customers can effectively run their business.

Truly Compact

The OC-4600 is a truly compact, full-featured high-speed cellular router that fits almost anywhere so customers can connect their equipment to the internet for ultra-reliable connectivity they can count on.
