

AOEM-GM24

Please read before installing interface.

1. For most vehicles, the warning chimes play through the front left speaker. This warning chime will be present on the **left front** RCA output of AOEM-GM24 interface and will be amplified through the aftermarket amplifier.
2. The factory headunit is a dual audio source unit. It can play CD audio on the front speakers and AM/FM audio on the rear headphone jacks or vice versa. Turning on rear entertainment console controls will make the rear outputs of the AOEM-GM24 interface play the second audio source.

There is **no way** to get around the factory warning chimes and rear headphone second audio source. Please read vehicle owner's manual to set the warning chimes to lower volume.
