

Strengthening Pear and Apple Resilience to Climate (SPARC)

Problem: Extreme heat and cold events that deviate from seasonal norms are increasing. These changes can result in major losses to apple and pear production.

Project Goals

- Evaluate temperature damage mitigation strategies
- Build models that allow for risk assessment and cultivar selection
- Characterize physiological and genetic mechanisms of cold and heat tolerance
- Identify temperature-related traits to be used in future scion and rootstock breeding
- Develop durable extension materials on heat and cold damage mitigation in pome fruit

Project Team

 Nationwide collaboration between seven institutions

This work is supported by the USDA NIFA - Specialty Crop Research Initiative project "Preparing U.S. Pome Fruit Production for Extreme Temperatures in a Changing Climate" (2024-51181-43289; Accession #1032988)

Current Work at TFREC

- Testing heat and cold protective spray products
- Investigating genetic control and physiology of sunburn
